Assay

Principle

The assay is based on the increase in absorbance at 500 nm as the formation of quinoneimine dye proceeds in the following reactions:

Unit definition

One unit is defined as the amount of enzyme which generates 1 μmole of H₂O₂ per minute at 37°C under the conditions specified in the assay procedure.

Reagents

1. Reaction mixture

0.2 M Tris-HCl buffer pH 8.0	0.20 ml
15 mM 4-AA solution	0.10 ml
0.2% (W/V) Phenol solution	0.10 ml

■ Enzyme solution

Accurately weigh about 20 mg of the sample and add enzyme dilution buffer to make a total of 20ml. Dilute it with enzyme dilution buffer to adjust the concentration to within 0.2–0.5 U/ml.

■ Procedure

- Pipette accurately 1.0 ml of reaction mixture into a reaction cuvette (1 ml volume black cuvette) and preincubate at 37°C.
- After 5 min, add 20 μ l of enzyme solution and mix to start the reaction at 37°C.
※ In the case of a test blank, add 20 μ l of enzyme dilution buffer in place of enzyme solution.
- After starting the reaction, measure the rate of increase in absorbance at 500 nm. The rate must be measured within the linear portion of the absorbance curve.

$$\text{Absorbance sample : As/min}$$

$$\text{blank : Ab/min}$$

$$\Delta A/\text{min} = (\text{As}/\text{min} - \text{Ab}/\text{min}) \leq 0.060 \text{ Abs}/\text{min}$$

■ Calculation

$$\text{Activity (U/mg of powder)} = \frac{\Delta A/\text{min}}{12.0 \times 1/2} \times \frac{1.02}{0.02} \times \frac{1}{X}$$
