■ Enzyme solution

Accurately weigh about 20 mg of the sample and add enzyme dilution buffer to make a total of 20 ml. Dilute it with enzyme solution buffer to adjust the concentration as required.

■ Procedure

- Mix reaction mixture I, substrate solution and reaction mixture II in a ratio of 6:1:3. Pipette accurately 1.0 ml of the mixture into a small test tube and preincubate at 37°C.
- After 5 min, add exactly 20 μ l of enzyme solution and mix to start the reaction at 37°C.
※ In the case of a test blank, add 20 μ l of enzyme dilution buffer in place of enzyme solution.
- At 10 min after starting the reaction, add 2.0 ml of the reaction stopper to stop the reaction.
- After 5 min, measure the absorbance at 565 nm.

$$\begin{array}{ll} \text{Absorbance sample : As} \\ \text{blank : Ab} \\ \Delta A = (As - Ab) \leq 0.400 \text{ Abs} \end{array}$$

■ Calculation

$$\text{Activity (U/mg of powder)} = \frac{\Delta A / 10}{23.56 \times 1/2} \times \frac{3.02}{0.02} \times \frac{1}{X}$$

23.56 : millimolar extinction coefficient of quinoneimine dye at 565 nm ($\text{cm}^2/\mu\text{mole}$)
1/2 : a multiplier derived from the fact that 2 mole of

H_2O_2 produces 1 mole of quinoneimine dye

10 : reaction time (min)

3.02 : final volume (ml)

0.02 : volume of enzyme solution (ml)

X : concentration of the sample in enzyme solution
(mg/ml)

Storage

Storage at -20°C in the presence of a desiccant is recommended. Enzyme activity will be retained for at least one year under this condition (Figure 5).
