Assay

Principle

The assay is based on the increase in absorbance at 340 nm as the formation of NADPH proceeds in the following reactions:

ATP: Adenosine triphosphate

NADP: Nicotinamide adenine dinucleotide phosphate

G6PDH II : Glucose-6-phosphate dehydrogenase

Unit definition

One unit is defined as the amount of enzyme which generates 1 μmole of NADPH per minute at 37°C under the conditions specified in the assay procedure.

■ Enzyme solution

Accurately weigh about 20 mg of the sample and add enzyme dilution buffer to make a total of 20 ml. Dilute it with enzyme dilution buffer to adjust the concentration as required.

■ Procedure

- Pipette accurately 3.0 ml of reaction mixture into a small test tube and preincubate at 37°C.
- After 5 min, add exactly 50 μ l of enzyme solution and mix to start the reaction at 37°C.
※ In the case of a test blank, add 50 μ l of enzyme dilution buffer in place of enzyme solution.
- After starting the reaction, measure the rate of increase per minute in absorbance at 340 nm. The rate must be measured within the linear portion of the absorbance curve.

$$\begin{aligned} \text{Absorbance sample} &: \text{As/min} \\ \text{blank} &: \text{Ab/min} \\ \Delta A/\text{min} &= (\text{As/min} - \text{Ab/min}) \leq 0.030 \text{ Abs/min} \end{aligned}$$

■ Calculation

$$\text{Activity (U/mg of powder)} = \frac{\Delta A/\text{min}}{6.22} \times \frac{3.05}{0.05} \times \frac{1}{X}$$

6.22 : millimolar extinction coefficient of NADPH at 340 nm
(cm² / μ mole)

3.05 : final volume (ml)

0.05 : volume of enzyme solution (ml)

X : concentration of the sample in enzyme solution
(mg/ml)

Storage

Storage at -20°C in the presence of a desiccant is recommended.
